

Requirements

1. **Mutual exclusion**

If one thread is in the critical section, then no other is

➔ Mutual exclusion ensures **safety property** (nothing bad happen)

2. **Progress**

If some thread T is not in the critical section, then T cannot prevent some other thread S from entering the critical section. A thread in the critical section will eventually leave it.

3. **Bounded waiting** (no starvation)

If some thread T is waiting on the critical section, then T will eventually enter the critical section

➔ Progress and bounded waiting ensures the **liveness property** (something good happen)

4. **Performance**

The overhead of entering and exiting the critical section is small with respect to the work being done within it

The concept of **lock** (a.k.a mutex)

- The **lock** supports three operations:
 - **init()**
creates an unlocked mutex
 - **acquire()**
waits until the mutex is unlocked, then locks it to enter the C.S
 - **release()**
unlocks the mutex to leave the C.S, waking up anyone waiting for it
