

Read Ahead

Many file systems implement "read ahead"

- FS predicts that the process will request next block
 - FS goes ahead and requests it from the disk
 - This can happen while the process is computing on previous block
 - Overlap I/O with execution
 - When the process requests block, it will be in cache
 - Compliments the disk cache, which also is doing read ahead
- ✓ For sequentially accessed files can be a big win
- Unless blocks for the file are scattered across the disk
 - File systems try to prevent that, though (during allocation)

File Sharing

File sharing has been around since timesharing

- Easy to do on a single machine
 - PCs, workstations, and networks get us there (mostly)
- ➔ File sharing is important for getting work done (basis for communication and synchronization)
- Two key issues when sharing files
 1. Semantics of concurrent access
 - What happens when one process reads while another writes?
 - What happens when two processes open a file for writing?
 - What are we going to use to coordinate?
 2. Protection
