File Access Method

Sequential access (used by file systems - most common) read bytes one at a time, in order (read/write next)

Random access (used by file systems)
random access given block/byte number (read/write bytes at offset n)

Indexed access (used by databases)

- · file system contains an index to a particular field of each record in a file
- reads specify a value for that field and the system finds the record via the index

Record access (used by databases)

- file is array of fixed-or-variable-length records
- read/written sequentially or randomly by record number

Basic File operations

Unix

- create (name)
- open (name, how)
- read(fd, buf, len)
- write(fd, buf, len)
- sync(fd)
- seek(fd, pos)
- close (fd)
- unlink(name)

Windows

- CreateFile(name, CREATE)
- CreateFile(name, OPEN)
- ReadFile (handle, ...)
- WriteFile (handle, ...)
- FlushFileBuffers (handle, ...)
- SetFilePointer(handle, ...)
- CloseHandle (handle, ...)
- DeleteFile (name)
- CopyFile (name)
- MoveFile (name)
