Rationale behind multi-level index files

- Most files are small
 ~2K is the most common size
- Average file size is growing
 Almost 200K is the average
- Most bytes are stored in large files
 A few big files use most of space
- File systems contains lots of files Almost 100K on average
- File systems are roughly half full Even as disks grow, file systems remain ~50% full
- Directories are typically small
 Many have few entries; most have 20 or fewer

Directories

Directories serve two purposes

- For users, they provide a structured way to organize files by using digestible names rather than inode numbers directly
- For the File System, they provide a convenient naming interface that allows the separation of logical file organization from physical file placement on the disk
