Naming Magic

Bootstrapping

Root directory always inode #2 (0 and 1 historically reserved)

Special names

- Root directory:"/"
- Current directory:"."
- Parent directory: "..."

Some special names are provided by shell, not FS

- User's home directory: "~"
- Globing: "foo. *" (expands to all files starting "foo.")

Using the given names, only need two operations to navigate the entire name space

- · cd name : move into (change context to) directory name
- 1s: enumerate all names in current directory (context)

Unix inodes and path search

Unix inodes are not directories

- Inodes describe where on the disk the blocks for a file are placed
- Directories are files, so inodes also describe where the blocks for directories are placed on the disk

Directory entries map file names to inodes

- 1. To open "/one", use Master Block to find inode for "/" on disk
- 2. Open "/", look for entry for "one"
- 3. This entry gives the disk block number for the inode for "one"
- 4. Read the inode for "one" into memory
- 5. The inode says where first data block is on disk
- 6. Read that block into memory to access the data in the file
