## 32 bits address space, 4K pages, 4 bytes/PTE

- How many bits in offset? 4K
   so the virtual address requires requires I 2 bits for the offset
- We want a master page table to fit in one page
   4K/4 bytes = IK possible entries
   so the virtual address requires IO bits for the master page index
- We also want a secondary page table to fit in one page so the virtual address requires IO bits for the secondary page index
- $\rightarrow$  10 + 10 + 12 = 32 bits address This is why 4K page size is recommended

## x86 Paging

- Paging enabled by bits in a control register %cr0
   (only privileged OS code can manipulate control registers)
- Register %cr3 points to 4KB page directory
   (for Pintos, see pagedir activate() in userprog/pagedir.c)
- Page directory has 1024 PDEs (Page Directory Entries) (see pagination details)
  - Each contains physical address of a page table
  - Each page table has 1024 PTEs (page table entries) and covers 4 MB of virtual memory
  - Each contains physical address of virtual 4K page
