## Example: a web server

```
while (1) {
  int sock = accept();
  if ((child_pid = fork()) == 0) {
    // Handle client request
  } else {
    // Close socket
  }
}
```

## Process creation on Unix using exec

```
int exec(char *prog, char *argv[])
```

- 1. Stops the current process
- 2. Loads the program "prog" into the process address space
- 3. Initializes hardware context and args for the new program
- 4. Places the PCB onto the ready queue
- → Actually, exec does not create a new process
