Variety is a challenge

- Problem: there are many devices and each has its own protocol
 - Some devices are accessed by I/O ports or memory mapping or both
 - Some devices can interact by polling or interrupt or both
 - Some device can transfer data by programmed I/O or DMA or both
- ✓ Solution : abstraction
 - Build a common interface
 - Write device driver for each device
- → Drivers are 70% of Linux source code

File System Abstraction

File system specifics of which disk class it is using
 It issues block read and write request to the generic block layer
