Directories

Directories serve two purposes

- For users, they provide a structured way to organize files by using digestible names rather than inode numbers directly
- For the File System, they provide a convenient naming interface that allows the separation of logical file organization from physical file placement on the disk

Basic Directory Operations

Unix

- → Directories implemented in file and a C runtime library provides a higher-level abstraction for reading directories
 - opendir(name)
 - readdir(DIR)
 - seekdir(DIR)
 - closedir(DIR)

Windows

- → Explicit dir operations
 - CreateDirectory(name)
 - RemoveDirectory(name)
 - FindFirstFile(pattern)
 - FindNextFile()
