# Second Chance implementation Version 2 : Clock algorithm

→ use the accessed bit supported by most hardware

### **Data structure**

circular linked list of pages (clock) with one pointer (hand)

### Code

- · on hit, set the corresponding page's accessed bit to I
- on miss
  - I. while hand's accessed bit is I, set hand's accessed bit to 0 and move to next page
  - 2. else if hand's accessed bit is 0, swap the hand's page with the new page and an move next page
- Better performances than fifo-like second chance (no rotation on miss)

## Other Replacement Algorithms

#### **Random eviction**

- Dirt simple to implement
- Not overly horrible (avoids Belady's anomaly)

## LFU (least frequently used) eviction

- Instead of just A bit, count # times each page accessed
- Least frequently accessed must not be very useful (or maybe was just brought in and is about to be used)
- Decay usage counts over time (for pages that fall out of usage)

## MFU (most frequently used) algorithm

- · Because page with the smallest count was probably just brought in and has yet to be used
- → Neither LFU nor MFU used very commonly
